

Why Scientist And Partner Co-Development Is Necessary Now

TRANSITION AFTER DECK 1

- The current platform already includes a public route, administration observability, an explainable baseline, and governance surfaces.
- The V2 infrastructure is real: Swiss RAvaFcast research, Himalayan v3 evidence templates, and one-command package triage.
- The science gap is also real: weak layers, regional transfer, quality-controlled labels, station coverage, and promotion evidence are unfinished.
- That gap is exactly where SASE/DGRE partners and the scientist team become central rather than decorative.

READY NOW

Decision-support platform

Public-facing product shell, operator evidence surfaces, and partner-intake templates already exist.

NOT READY NOW

Scientific closure

The next phase is about SASE/DGRE evidence handoff, benchmark ownership, and validation ownership, not declaring victory.
